Ryan Adams, lecturer  
Department of Horticulture

### Introduction

The National Turfgrass Evaluation Program (NTEP) conducts trials throughout the United States on turfgrass adaptation. This trial was established in September 2012 as a part of the NTEP program. This is the second year data have been collected on this trial. It contains 116 turf type tall fescue cultivars.

### Materials and Methods

The individual plots measure 5 ft × 5 ft and the study was replicated three times. Quality ratings were conducted monthly in 2014. Spring greenup data were taken on May 5, 2014, while genetic color and texture uniformity was taken in early September. Ratings were based on a scale of 9 = best quality and 1 = lowest quality. A rating of 6 or

above is considered to be commercially acceptable. In the case of color and uniformity, a 9 is the darkest green color and a 9 is the most uniform turf. The plots were only irrigated to prevent dormancy.

### Results and Discussion

Table 1 contains spring greenup, genetic color, texture uniformity, and quality ratings for the 2014 season. The mean quality rating was calculated for each cultivar. There were significant differences in the mean quality, spring greenup, texture uniformity, and genetic color ratings for the year. We will continue to take data for three more years. The data also is submitted to NTEP each year and will be included in their yearly report with data from the other states conducting this trial. The data can be found at [www.ntep.org](http://www.ntep.org).

### Acknowledgements

Appreciation is extended to the NTEP organization for funding to conduct this project.
